

前言

为了进一步了解以太坊区块链网络的工作方式和运行原理，笔者通过官方软件Geth搭建了私有以太坊网络fantasynetwork，最终实现了单机和多机节点间的相互连通：首先通过VMware Workstation创建基础Ubuntu实验平台，再安装Golang1、Geth2等依赖环境；其次使用puppeth工具生成私网的配置文件fantasynetwork.json并复制到三个节点目录下，三个节点均使用该配置文件初始化网络；最后使用static-nodes.json的方式将三个节点设为默认接入节点，实现节点间的连通，连通后各节点中的账户可以互相转账挖矿。

单机多节点私网3

本试验的项目结构为：

```
privateNet      ??? accounts.txt      ??? fantasynetwork.json
  ??? node1      ?    ??? geth      ?    ??? keystore      ?    ??? no
de.sh      ?    ??? password.txt      ?    ??? static-nodes.json
  ??? node2      ?    ??? geth      ?    ??? keystore      ?    ??? n
ode.sh      ?    ??? password.txt      ?    ??? static-nodes.json
  ??? node3      ??? geth          ??? keystore        ????
node.sh           ??? password.txt      ??? static-
nodes.json
```

创建工作目录

1. 创建私网工作目录mkdir privateNet && cd privateNet
2. 创建三个节点数据目录mkdir node1 node2 node3

```
privateNet/ ??? node1 ??? node2 ??? node3
```

创建默认用户

1. Node1

```
test@ubuntu:~/privateNet$ geth --datadir node1/ account new
Your new account is locked with a password. Please give a p
assword. Do not forget this password. Password: Repeat passw
ord: Your new key was generated Public address of the key:
0x600d77B8ce36B829BFC8a1Cc5696Faf2218bDf75 Path of the secr
et key file: node1/keystore/UTC--2021-08-11T04-51-26.5334827
15Z--600d77b8ce36b829bfc8a1cc5696faf2218bdf75
```

Node 2

```
test@ubuntu:~/privateNet$ geth --datadir node2/ account new
Your new account is locked with a password. Please give a p
assword. Do not forget this password. Password: Repeat passw
ord: Your new key was generated Public address of the key:
0x2F7fd5BD0026f7C2f0dB94b79D58AFE517BC56d2 Path of the secr
et key file: node2/keystore/UTC--2021-08-11T04-53-30.8209149
94Z--2f7fd5bd0026f7c2f0db94b79d58afe517bc56d2
```

Node3

```
test@ubuntu:~/privateNet$ geth --datadir node3/ account new
Your new account is locked with a password. Please give a p
assword. Do not forget this password. Password: Repeat passw
ord: Your new key was generated Public address of the key:
0x6c1440E9c6Ca93C18B1e2A069D1D5a70e29C2363 Path of the secr
et key file: node3/keystore/UTC--2021-08-11T04-54-24.2444871
86Z--6c1440e9c6ca93c18b1e2a069d1d5a70e29c2363
```

在此创建账户的密码设置为**fantasy**
，操作完成后会在每个节点目录下的**keystore**
目录中找到账户密钥文件/钱包地址。

保存账户凭证

1. 将以上账户的公钥地址保存至文本文件

```
echo '0x600d77B8ce36B829BFC8a1Cc5696Faf2218bDf75' >> accounts.txt
echo '0x2F7fD5BD0026f7C2f0dB94b79D58AFE517BC56d2' >> accounts.txt
echo '0x6c1440E9c6Ca93C18B1e2A069D1D5a70e29C2363' >> accounts.txt
```

为了实验方便，将账户对应的密码文件保存至对应节点目录下

```
echo 'fantasy' > node1/password.txt
echo 'fantasy' > node2/password.txt
echo 'fantasy' > node3/password.txt
```

创建配置文件

1. 设置网络名称

```
test@ubuntu:~/privateNet$ puppeth Please specify a network name to administer (no spaces, hyphens or capital letters please) > fantasynetwork Sweet, you can set this via --network=fantasynetwork next time! INFO [08-10|22:08:31.110] Administering Ethereum network name=fantasynetwork WARN [08-10|22:08:31.110] No previous configurations found path=/home/test/.puppeth/fantasynetwork
```

选择程序功能

```
What would you like to do? (default = stats)
1. Show network stats
2. Configure new genesis
3. Track new remote server
4. Deploy network components > 2
```

选择创建网络

```
What would you like to do? (default = create)
1. Create new genesis from scratch
2. Import already existing genesis > 1
```

选择共识算法

```
Which consensus engine to use? (default = clique)
1. Ethash - proof-of-work
2. Clique - proof-of-authority > 1
```

选择默认账号

```
Which accounts should be pre-funded? (advisable at least one)
e) > 0x600d77B8ce36B829BFC8a1Cc5696Faf2218bDf75 > 0x2F7fd5BD
0026f7C2f0dB94b79D58AFE517BC56d2 > 0x6c1440E9c6Ca93C18B1e2A0
69D1D5a70e29C2363 > 0x
```

设置默认单位

```
Should the precompile-addresses (0x1 .. 0xff) be pre-
funded with 1 wei? (advisable yes) > yes
```

设置网络ID

```
Specify your chain/network ID if you want an explicit one (
default = random) > 7777 INFO [08-10|22:16:40.485] Configure
d new genesis block
```

导出配置文件

```
What would you like to do? (default = stats)
1. Show network stats
2. Manage existing genesis
3. Track new remote server
4. Deploy network components > 2
  1. Modify existing configurations
  2. Export genesis configurations
  3. Remove genesis configuration > 2
    Which folder to save the genesis specs into? (default = current)
    Will create fantasynetwork.json, fantasynetwork-aleth.json,
    fantasynetwork-harmony.json, fantasynetwork-parity.json > INFO [08-10|22:18:48.283]
    Saved native genesis chain spec path=fantasynetwork.json
    INFO [08-10|22:18:48.285] Saved genesis chain spec
    client=aleth path=fantasynetwork-aleth.json
    INFO [08-10|22:18:48.286] Saved genesis chain spec
    client=parity path=fantasynetwork-parity.json
    INFO [08-10|22:18:48.287] Saved genesis chain spec
    client=harmony path=fantasynetwork-harmony.json
```

退出工具

```
What would you like to do? (default = stats)
1. Show network
```

stats2. Manage existing genesis3. Track new remote server4.
Deploy network components> ^C

此时可在当前
目录下看见生成的四个配置
文件，在此只用到`fantasyNetwork.json`文件，其他文件可删去。

10. 修改配置文件

为了更容易挖到矿，将配置文件中`difficulty`
难度值调小(其它参数含义可参考《创世区块配置文件genesis.json的格式
解读》4)：

```
root@ubuntu:/privateNet/node1$ geth --nousb --datadir=$pwd --syncmode='full' --port 27278 --miner.gasprice 0 --miner.gastarget 470000000000 --http --ht
tp.addr 'localhost' --http.port 7272 --http.api admin,eth,mi
ner,net,txpool,personal,web3 --mine --allow-insecure-unlock

74978523-9546-4282-9415-5311452088c4@icloud.com[4]:27278
```

头条:@海椰人

得到节点一的enode

```
enode://0f870fa3f8085f5abf74ea7c2a12a0809a9daaece20e3b1c4c80
fb6929ff652681068c6ffd47852a4544dc282a4a15f531b452e05c4f1cf6
861d4fb3b728edeb@127.0.0.1:27271
```

Node2

```
geth --nousb --datadir=$pwd --syncmode 'full' --port 27272 -
-miner.gasprice 0 --miner.gastarget 470000000000 --http --ht
tp.addr 'localhost' --http.port 7272 --http.api admin,eth,mi
ner,net,txpool,personal,web3 --mine --allow-insecure-unlock
--unlock "0x2F7fD5BD0026f7C2f0dB94b79D58AFE517BC56d2" --pass
```

word password.txt

得到节点二的enode：

```
enode://45c2fc2bfd0f48afe2083d82cc1cc642a96fcc2815755024a17  
b95b9fd1b3124f89e186c88a5013ced1c00bd10060a90e6b53e94fdbbfaf6  
098b3088b3f78274@127.0.0.1:27272
```

Node3

```
geth --nousb --datadir=$pwd --syncmode 'full' --port 27273 -  
-miner.gasprice 0 --miner.gastarget 470000000000 --http --ht  
tp.addr 'localhost' --http.port 7273 --http.api admin,eth,mi  
ner,net,txpool,personal,web3 --mine --allow-insecure-unlock  
--unlock "0x6c1440E9c6Ca93C18B1e2A069D1D5a70e29C2363" --pass  
word password.txt
```

得到节点三的enode：

```
enode://ae4b4e18afa6238753e14ca3e99c0858509fc76efee715dd1c82  
78bbb7eaa5614fdc8b77a82bf7baf128c14ef574cc6701514fb97780d30  
c731f7bc82df932@127.0.0.1:27273
```

连通三个节点

Geth

主要有三种方法连通其它节点：启动前

配置static-nodes.json文件添加节点、启动时通过--bootnodes

添加节点、启动后在控制台通过admin.addPeer

命令添加节点。在此我们使用第一种方法。

1. 在工作目录下创建static-nodes.json

```
[ "enode://0f870fa3f8085f5abf74ea7c2a12a0809a9daaece20  
e3b1c4c80fb6929ff652681068c6ffd47852a4544dc282a4a15f531b452e  
05c4f1cf6861d4fb3b728edeb@127.0.0.1:27271", "enode://45c2  
fc2bfd0f48afe2083d82cc1cc642a96fcc2815755024a17b95b9fd1b312  
4f89e186c88a5013ced1c00bd10060a90e6b53e94fdbbfaf6098b3088b3f7  
8274@127.0.0.1:27272", "enode://ae4b4e18afa6238753e14ca3e
```

```
99c0858509fc76efee715dd1c8278bbb7eaa5614fdc8b77a82bf7baf128c  
14ef574cc6701514fbb97780d30c731f7bc82dfd932@127.0.0.1:27273"  
]
```

将该文件复制到每个节点根目录下：

```
cp static-nodes.json node1/cp static-  
nodes.json node2/cp static-nodes.json node3/
```

为了简化启动，可以创建启动节点批处理文件

- node1/node.sh

```
nohup geth --nousb --datadir=$pwd --syncmode 'full' --port 2  
7271 --miner.gasprice 0 --miner.gastarget 470000000000 --htt  
p --http.addr 'localhost' --http.port 7271 --http.api admin,  
eth,miner,net,txpool,personal,web3 --mine --allow-insecure-u  
nlock --unlock "0x600d77B8ce36B829BFC8a1Cc5696Faf2218bDf75"  
--password password.txt &echo "Geth started on node 1"
```

node2/node.sh

```
nohup geth --nousb --datadir=$pwd --syncmode 'full' --port 2  
7272 --miner.gasprice 0 --miner.gastarget 470000000000 --htt  
p --http.addr 'localhost' --http.port 7272 --http.api admin,  
eth,miner,net,txpool,personal,web3 --mine --allow-insecure-u  
nlock --unlock "0x2F7fD5BD0026f7C2f0dB94b79D58AFE517BC56d2"  
--password password.txt &echo "Geth started on node 2"
```

node3/node.sh

```
nohup geth --nousb --datadir=$pwd --syncmode 'full' --port 2  
7273 --miner.gasprice 0 --miner.gastarget 470000000000 --htt  
p --http.addr 'localhost' --http.port 7273 --http.api admin,  
eth,miner,net,txpool,personal,web3 --mine --allow-insecure-u  
nlock --unlock "0x6c1440E9c6Ca93C18B1e2A069D1D5a70e29C2363"  
--password password.txt &echo "Geth started on node 3"
```

启动各节点

```
test@ubuntu:~/privateNet/node1$ sh node.sh
test@ubuntu:~/privateNet/node2$ sh node.sh
test@ubuntu:~/privateNet/node3$ sh node.sh
```

打开三个终端，使用`geth attach`命令接入三个节点命令行

```
test@ubuntu:~/privateNet/node1$ geth attach geth.ipc
test@ubuntu:~/privateNet/node2$ geth attach geth.ipc
test@ubuntu:~/privateNet/node3$ geth attach geth.ipc
```

```
geth --jrpcCount=3
{
  "node1": {
    "host": "192.168.1.100",
    "port": 22222,
    "wsPort": 22223,
    "httpPort": 22224,
    "pp2pPort": 22225,
    "ipcPath": "/tmp/geth.ipc",
    "network": "mainnet"
  },
  "node2": {
    "host": "192.168.1.101",
    "port": 22222,
    "wsPort": 22223,
    "httpPort": 22224,
    "pp2pPort": 22225,
    "ipcPath": "/tmp/geth.ipc"
  },
  "node3": {
    "host": "192.168.1.102",
    "port": 22222,
    "wsPort": 22223,
    "httpPort": 22224,
    "pp2pPort": 22225,
    "ipcPath": "/tmp/geth.ipc"
  }
}
```

头条 @海椰人

此时各节点已连接完成，每个节点账户默认为10个以太币，各节点账户间可自由转账和挖矿，需要注意的是转账后必须经过挖矿操作才能被写入区块链。上方法启动后的程序将会运行在后台，关闭需通过`ps ax | grep geth`命令和`kill <process id>`命令。

多机多节点私网

准备

1. 设置上节Ubuntu虚拟机网络模式为桥接，且IP设为静态IP172.25.1.99
2. Windows的IP设为静态172.25.1.55

加入私网

1. 在Windows下创建文件夹node4，并将fantasyNetwork.json复制到其中
2. 初始化节点4

```
C:\Users\Fantasy\Desktop\node4> geth --datadir . init fantasynetwork.json
```

新建账户

```
C:\Users\Fantasy\Desktop\node4>geth -datadir . console> personal.newAccount("fantasy")WARN [08-11|16:13:32.987] Please remember your password! "0xbef61b5754ffaa843cc9199fb9a11aac468134f4"> exit
```

启动节点4

```
geth --nousb --datadir=. --syncmode "full" --port 27271 --miner.gasprice 0 --miner.gastarget 470000000000 --http --http.addr 0.0.0.0 --http.port 7271 --http.api admin,eth,miner,net,txpool,personal,web3 --mine --allow-insecure-unlock console
```

添加节点1

```
> net.peerCount0> admin.addPeer("enode://0f870fa3f8085f5abf74ea7c2a12a0809a9daaece20e3b1c4c80fb6929ff652681068c6ffd47852a4544dc282a4a15f531b452e05c4f1cf6861d4fb3b728edeb@172.25.1.9:27271")true> net.peerCount1
```

此时各节

点已连接完成，各

节点账户间可自由转账和挖矿，需要

注意的是转账后必须经过挖矿操作才能被写入区块链。

注意事项：

- 很多教程中说不同节点启动时不能使用相同的端口，那是因为其运行在同一个主机上，这里节点1和节点4运行在不同的端口上，故可以使用相同的端口。
- 添加节点无效常见原因/解决办法：`admin.addPeer` 后等一段时间才会生效`admin.addPeer` 时使用的是NAT后公网地址，而公网防火墙通常拒绝异常接入`admin.addPeer`

后开始挖矿增加同步

速度简单的方法是使用上节中的**static-nodes.json**方法
